

## What is HTTP-tunneling?

**HTTP Tunneling** is a technique by which communications performed using various network protocols are encapsulated using the HTTP protocol, the network protocols in question usually belonging to the TCP/IP family of protocols. The HTTP protocol therefore acts as a wrapper for a covert channel that the network protocol being tunneled uses to communicate.

In brief, a "tunnel" is created between your PC and the remote server and it *appears* as though the **remote MySQL database** is run locally.

- you have the opportunity to reach out to the internet only through HTTP-proxy.
- in your network is set to the opportunity to work with port 80.
- hosting provider are allowed to work with the database only via localhost.
